

# Training & Competence

*One Platform. One Truth. Competence, Not Just Courses.*

Systemic Compliance builds an operator's competence and training system to the operator's OWN procedures, never below the regulatory floor, through two engines that work together. The Competence & Progression Framework (CPF) defines what competence a role requires and in what order; Competence Architect builds the training that delivers it. Because both draw from one set of unit definitions, the training content, the OQ evaluation criteria, and the progression plan stay in sync.

## The Challenge vs. the Systemic Solution

| The Cost of Today's Approach                                                                  | The Systemic Solution                                                                                          |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Generic, off-the-shelf courses that do not match how the operator actually performs the work. | Training authored to the operator's own procedures, with the regulatory floor as the backstop.                 |
| Training, OQ evaluation criteria, and progression plans drift apart in separate systems.      | One set of unit definitions keeps content, OQ criteria, and the progression plan in sync.                      |
| Unclear what a role must know, and in what order, to be competent.                            | The CPF resolves the required knowledge, skills, and abilities and sequences them by prerequisite and cadence. |
| A single course format that is hard to scale across sites and states.                         | One Training Object renders to four delivery vehicles and covers the multi-state union in a single course.     |

## Two Engines

### Competence & Progression Framework (CPF)

- Role to competence: for any job or craft family, resolves the required knowledge, skills, and abilities, anchored upstream to the operator's O&M procedures (OQ covered tasks and CFR/B31Q are derived from them).
- Sequenced progression: orders training by prerequisite and cadence and stages a new hire's path; supports an optional skill-based-pay or apprenticeship ladder.
- Stringency made visible: flags item-by-item where the operator's requirement exceeds or adds to the regulatory floor, and structures the operator's OQ evaluation criteria from the same definitions.

### Competence Architect

- One source, four vehicles: authors one platform-agnostic Training Object and renders it to on-the-job, self-study, instructor-led, and computer-based training, each with a written exam.
- Built to the operator, fully traceable: backward-designed (objectives, then assessment, then content) with requirement-to-evidence traceability; LMS-packaged (SCORM / xAPI) and operator-branded.
- A growing item bank: SME-validated questions produce blueprint-balanced exams with secure answer keys.

## Training Vehicles

| Vehicle              | What it delivers                                                                                    |
|----------------------|-----------------------------------------------------------------------------------------------------|
| On-the-job (OJT)     | Structured field guide and skills checklist with a written exam, for hands-on qualification.        |
| Self-study           | Reading-and-exercise module with a written exam, for knowledge content at the worker's pace.        |
| Instructor-led (ILT) | Facilitator guide and participant materials with a written exam, for classroom or toolbox delivery. |
| Computer-based (CBT) | SCORM/xAPI package with embedded assessment, delivered and tracked in the SC.ORB LMS.               |

## What We Deliver

- Role-based competence and progression plans, and role-derived course inventories with build/assign status.

- Courses in all four vehicles, each with exams; OJT guides, instructor guides, and self-study guides.
- OQ evaluation-criteria structure; gap-and-consistency notes against the operator's procedures.
- LMS-ready packages; assignment and completion tracking through SC.ORB.

## Where It Is Used

- New-hire onboarding and role progression, including optional skill-based-pay ladders.
- Requalification after a procedure change, triggered precisely by the SC.MOC ripple.
- Employee and contractor training, built to each covered-task list.
- One-course multi-state coverage, built to the union of federal, operator, and each operating state's requirements.
- Included with an SC.ORB platform switch as the operator's covered-task training library.

## How We Build It

Operator-procedure primacy throughout; three-tier sourcing (governing regulation/standard, the operator's own procedures, and verified external references); backward design; and SME validation on every course. The approach is industry-agnostic and reusable across operators.

## Industry Cost Context (for reference)

For context, independent industry sources indicate that custom, professionally developed training is a substantial undertaking. Published 2025-2026 benchmarks for fully custom development include:

| Reference (fully custom development)                                      | Published range                                   |
|---------------------------------------------------------------------------|---------------------------------------------------|
| Custom eLearning, per finished hour of seat time                          | ~\$5,000 - \$50,000 (2026; some estimates higher) |
| Development effort per finished hour, by interactivity (Chapman Alliance) | ~49 hours (basic) to ~490-716 hours (advanced)    |

*These figures are general third-party industry references provided for context only. They are not a quotation, not a comparison to Systemic Compliance's fee, and not a guarantee of savings. Actual costs vary by scope, complexity, format, and provider. Sources: BlueCarrot (2026); AllenComm (2026); Chapman Alliance (2010 research); Cognota.*

## Engagement Model

The CPF (defining the competence and progression architecture) and the training build (through Competence Architect) are separate, sequential engagements: define the model first, then build the identified training. The CPF can be a standalone engagement or the first phase of an integrated training build.

**Ready to turn courses into competence? Contact Systemic Compliance to scope a competence and progression engagement for your operation.**
